Revision TKA

**RHO - RTKA** is the surgical navigation software for Revision Total Knee arthroplasty. Accurate soft tissue balancing, proper restoration of limb alignment and joint line height are main challenges to be faced for a successful outcome. Bones conditions and ligaments instability can introduce several surgical complexities. **RHO - RTKA**, deeply focused on those goals, supports the surgeon for an accurate surgical strategy definition and provides a precise guiding during the entire procedure.

## Main Technical Features:

1

Safe redundant anatomical landmarks detection performed **after prosthesis removal**.

2

Accurate **best joint line height planning** based on redundant patient specific anatomical landmarks.

3

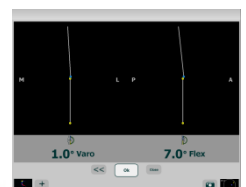

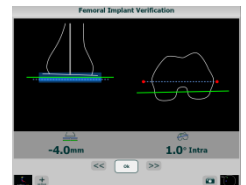

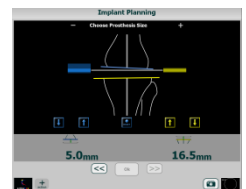

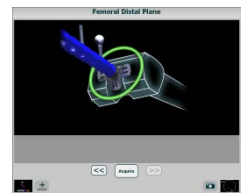

Precise guidance for intra-operative **joint line restoration**, on femoral and on tibial side. Best **rotational components positioning** control.

4

**Optimized instrumentation** compatible with any conventional surgical instrumentation. **Customizable Surgical workflow** adaptable to surgeon needs.

5

Detailed assessment of obtained **limb alignment and ROM**.
